"Contributions to the Study of the Efficiency of Anti-influenza Vaccinations with Live Vaccine."

Bucharest, Studii si Cercetari de Inframicrobiologie, Vol 17, No 5, 66, pp 389-394

Abstract: The authors analyze the serologic results of a Soviet bivalent (A_2 + B) live influenza vaccine. The vaccine was administered by intranasal instillation in two doses to 142 children in a vocational schoo, and was also used in two factories in Bucharest in the first quarter of 1965. It is stressed that the antibody level at the time of vaccination must be taken into consideration in the evaluation.

Includes 6 tables and 10 references, of which 5 Rumanian, 2 Russian and 3 Western. -- Manuscript submitted 6 February 1966.

AUTHORS: Solomon, [illegible], and Stoicescu, [illegible] A RUM/5-9-9-9/25

TITLE: Polymerization of 2,3-Dimethyl-Butadiene-1,3 With Ziegler Catalysts (Polimerizarea 2,3-dimetil-butadienei-1,3 cu catalizatori Ziegler). First Note (Nota I)

PERIODICAL: Revista de Chimie, Vol 9, Nr 9, pp 507 - 509 (RUM)

ABSTRACT: In this article, the authors present the preliminary results of research and experiments on the polymerization of 2,3-dimethyl-butadiene in the presence of a complex catalyst consisting of diethyl aluminum and titanium tetrachloride. The catalyst was obtained in the reaction medium. The Al/Ti (mol) rate varied between 1.18 and 5.0. Time of reaction was from 10 to 100 hours. Temperatures were 50 and 20°C. The catalyst remnants were removed with alcohol. The obtained product was separated into two fractions by dissolution in benzene at normal temperature. The soluble fraction within the benzene solution was subjected to precipitation with ethanol. The 2,3 dimethyl butadiene was derived from pinacol. The dimethyl butadiene had the following physical constants: p.f. - 69.5 ± 0.1°C at 757 mm mercury column; d_{20} - 0.726 ± 0.001 g per cm³; and n_D^{20} - 1.4377. The titanium tetrachloride was a 40% benzene sus-

Polymerization of 2,3-Dimethyl-Butadiene-1,3 With Ziegler Catalysts. First Note

pension, and the aluminum-diethyl mono-chloride was a 30% benzene solution To determine the intrinsic viscosity of insoluble fractions obtained in polymerizations at 50°C and at 20°C, the authors used various solvents such as n-hexane, decalin, tetralin, xylene, toluene, and cold and hot carbon tetrachlorids, but none of the solvents could solubilize the insoluble fractions The results are indicated in Tables 1 and 2 There are 2 tables and 9 references, 4 of which are Italian, 1 German, 2 Soviet, 1 English, and 1 Rumanian

AUTHORS: Stoicescu, L., and Stamatescu, C., Professors, Engineers

TITLE: Heat Recovery in Ferrous Metallurgy Furnaces (Part I)

PERIODICAL: Metalurgia şi construcţia de maşini, 1959, Nr 9, pp 756-762 (RUM)

ABSTRACT: The authors point out that the utilization of the whole energy available in a certain metallurgical process (steelwork, forge, foundry, etc) is the main problem, after the metallurgical one, in the design and operation of a plant section. The problem of energy is particularly important in ferrous metallurgy, where high quantities of thermal energy are involved. The problem of heat recovery in metallurgical furnaces is compared first with heat recovery in modern boiler systems and it is concluded that heat recovery in metallurgy is a much more complicated problem. The authors affirm that almost two decades ago, Soviet scientists and engineers analyzed the basic problems of heat recovery in ferrous

Heat Recovery in Ferrous Metallurgy Furnaces (Part I)

metallurgy. In metallurgical furnaces the most important ways of heat loss are: evacuation of the hot gases let out from the circuit of the furnace process, heat in the cooling water used in Martin furnaces, rolling-mill furnaces, blast furnaces, etc; the "physical" heat of the furnace gases, for the recovery of which there is no adequate technological solution as yet; blast-furnace slag heat, Martin furnace, Thomas converter slag heat, heat in the rolled products, in the chills; losses in conducts, leakages, radiation, etc. Fig 1 presents a graph of the losses of heat in a ferrous metallurgical combine. The total quantity of heat loss in Fig 1 is 381 x 10^6 kcal/hr, or 1.9 x 10^6 kcal/ton of ingot steel, corresponding to about 1/3 of the neat heat consumption. The present level of technology allows the recovery of about 244 x 10^6 kcal/hr, namely 128 x 10^6 kcal/hr in the power plant, 68 x 10^6 kcal/hr as heat energy for water heating, and possibly for the power plant, and 48 x 10^6 kcal/hr for heating. The calculations

APPROVED FOR RELEASE: 08/26/2000 CIA-RDP86-00513R001653320016-4"

were continued for the same metallurgical combine and ways were determined to cover the entire energy consumption of the combine by means of the secondary internal sources of energy. The results are shown in Fig 2. The necessary electrical energy expressed in power consumed by the whole combine is 48 megawatts. The possible production of electrical energy is the following: 60 megawatts through the power engines operated on furnace gas, 46 mw through the utilization of the recoverable quantity of heat led out from the circuit of the metallurgical processes. In this case, it is shown that a surplus of 46 mw is available. The warm water and heating necessities are 36×10^6 kcal/hr. The total possibility of production, through recovery of the heat of hot gases, of the steam heat, etc, 48×10^6 kcal/hr. The main sources of heat recoverable from the metallurgical process are given in Table 1. Continuing, the authors examine the recovery problem of a system constituted by the metallurgical hearth furnace. The

Heat Recovery in Ferrous Metallurgy Furnaces (Part I)

flow diagram of a Martin furnace is given in Fig 3. The authors examine the problem of efficiency by defining and examining the efficiency of the combustion (η_f), the efficiency of the furnaces "metallurgical space" (η_r), the efficiency of operation (η_b), and the efficiency of the furnace (η_o). The values of η_f are represented in the graphs Figs 4 and 5 for water gas, coking gas, furnace gas, mixture (coke and furnace) gas and gas holder gas. The variation of the efficiency η_r is presented in Fig 6. Finally, recommendations are made for the establishing of the heat balance starting from the diagram of the heat flow as represented in Fig 3. The article will be continued. There are 6 graphs and 3 diagrams.

TITLE: Pharmacodynamic action of trimethylene bis-4-hydroxy-iminomethyl-pyridine bromide

SOURCE: Revista sanitara militara, v. 61, no. 1, 1965, 113-117

TOPIC TAGS: pharmacology, organic phosphorus compound, antidote, organic imine compound, toxicity, rat, pyridine

ABSTRACT: The authors studied the pharmacodynamic action of TMB4 on normal animals. (The compound is used as antidote for organophosphorus intoxications, and previous studies refer to its action in intoxicated animals.). They found an index of toxicity, DL_{50} = 63 mg/kg ± 2.5 in rats, and found a dose of 5 mg/kg to have the following effects: nicotinolytic action; ganglioplegic action; excitation of respiration; and potentiation of ether anesthesia. Orig. art. has: 7 figures and 2 tables. [JPRS]

The antituberculous action of several anil derivatives of p-aminosalicylic and p-amino-o-halobenzoic acids, C. V. Obregbia, L. Stoicescu-Crivetz, A. Toma, and M. Cuc. Examinarea [illegible] Acad. Rep. Populare Romîne, Studii Cercetări Chim. 2, 39-48(1954)(French summary).—The anils of p-amino-o-halobenzoic (I) and p-aminosalicylic (II) acids with anisaldehyde (III) and p-dimethylaminobenzoic aldehyde (IV) generally have, in vitro, a bacteriostatic action on Koch's bacillus. Ten derivs. were prepd., all of which had either similar or lower antituberculous action than their corresponding acids. Thus, treating IV (0.16 g.) in 5 ml. EtOH with II (0.2 g.) in 10 ml. EtOH and adding a few drops of HCl gave yellow-orange 3,4-HO(HO$_2$C)C$_6$H$_3$N:CHC$_6$H$_4$NMe$_2$-p.H$_2$O.HCl (V), m. 223° sol. in H$_2$O and EtOH, insol. in Et$_2$O. Similarly, treating I and IV gave 3,4-R(HO$_2$C)C$_6$H$_3$N:CHC$_6$H$_4$NMe$_2$-p.H$_2$O.HCl (R = Br), orange crystals, m. 232°, sol. in EtOH and warm H$_2$O, insol. in Et$_2$O, C$_6$H$_6$; R = Cl, yellow, m. 230°; R = Iodo, dark orange, m. 238. Other derivs.: p-Me$_2$NC$_6$H$_4$CH:NC$_6$H$_3$CO$_2$H-p'.H$_2$O.HCl, red orange crystals, m. above 230°, is not pptd. by H$_2$SO$_4$ or AcOH; Et ester, m. 218-20°; p-MeOC$_6$H$_4$CH:NC$_6$H$_3$(OH)CO$_2$H-3,4.H$_2$O.HCl, yellow crystals, m. 270° (decompn.) (prepd. from III and II); p-MeOC$_6$H$_4$CH:NC$_6$H$_3$(R)CO$_2$H-3,4.HCl where R = Cl and Iodo, resp.; p-Me$_2$NC$_6$H$_4$CH:NC$_6$H$_3$(OH)CO$_2$H-3,4.C$_6$H$_2$(NO$_2$)$_3$OH, orange crystals m. above 230°, sol. in alkali, recrystallizes upon addn. of picric acid.

SOURCE: Revista de chimie, v. 16, no. 5, 1965, 294-295

TOPIC TAGS: quantitative analysis, chloroform, perchloric acid, dioxane, pharmacology, drug

ABSTRACT: The authors describe a method for the determination in non-aqueous medium of this anesthetic substance, either pure or as the injectable solution. The method involves titration in chloroform solution with a solution of perchloric acid in dioxane, using metanil yellow as indicator; it is simple and accurate and is suggested for use in quality control. "Some Data About Microbial Resistance."

Sofia, Suvremenna Meditsina, Vol 14, No 5, 1963; pp 47-48.

Abstract : Authors' studies with a total of 6667 strains of 3 gram pos. and 3 gram negative species 1957-1961 show that sensitivity to 6 antibiotics is increasing in a frighteningly regular manner (actual data not shown). Discussion of methods to counteract the increased resistance: precise etiological diagnosis, rational therapy, using antibiotics in conjunction with all other supportive and therapeutic devices available.
